1. Reporting Organisation:

GMR Warora Energy Limited (Formerly EMCO Energy Limited)

2. Description of the organisation

About GMR Warora Energy

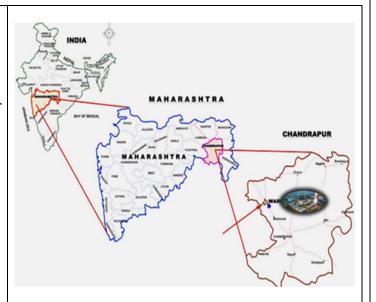

Ltd.(GWEL)

GMR Warora Energy Ltd (Formerly

EMCO Energy Limited) is a subsidiary of GMR Energy Ltd. Operates 2 x 300 MW Coal Based power plant at Warora MIDC, Chandrapur district of Maharashtra, 90 km from Nagpur. Electricity Generated is transmitted through Power Grid Corporation of India Ltd., Bhadrawati, 35 Km from plant location. Supplies power under Long term power purchase agreement.

91% Capacity tied up with Long term customer ensuring sustainability. Fuel supply agreement in place for the entire life of PPA.

GWEL is fully tied up under long term PPA for 200 MW with Maharashtra State Electricity Distribution Company Limited (MSEDCL), 150 MW with Gujarat Urja Vikas Nigam Limited (GUVNL) and 150 MW with Tamil Nadu Generation and Distribution Corporation (TANGEDCO).

GHG Inventory Report FY 22-23

GWEL's gross power generation capacity is 600 MW (2 x 300 MW), consisting of subcritical type coal fired boilers. The technology & major equipment used at the plants are boilers and auxiliaries, turbo-generators, transformers and auxiliaries, equipment for coal and ash handling, fuel oil system, de-mineralized water plant and other associated equipment. The equipment's are operated and controlled by state-of-art control and instrumentation system which includes Digital Distribution Control (DDC), Programmable Logic Control (PLC), and Supervisory Control & Data Acquisition System (SCADA).

The safety of the generation process is ensured through protection and interlock system such as DEH (Digital Electro Hydraulic Governing), FSSS (Furnace Safeguard Supervisory System), etc. IT infrastructure is extensively used within the company. Integrated ERP system (SAP) is used for carrying out all transactions, HR operations, etc. Distributed Control Systems (DCS) and various other modern plant automation systems at the plant ensure real time monitoring and control of plant operations and environmental performance parameters. Further, stack and ambient air parameters are monitored online as well as off-line.

GWEL is the foremost Integrated Energy Organization to implement all key SAP modules and other customized IT applications in record time. This has resulted in ensuring seamless access to Enterprise ERP for enhanced availability, accuracy, reliability, security, and confidentiality of Data and Information.

Plant Process Flow:

- Coal is received through rail wagons, unloaded by wagon tippler, transported through belt conveyors and crushed at crusher house.
- · Crushed coal stacked at coal yard through stacker.
- Coal is fed to bunkers through network of belt conveyors by reclaiming from coal yard by Reclaimer
- The coal is drawn from the bunkers by gravimetric feeders and fed into the coal pulveriser (mills).
- In the mills the coal is dried by hot air, pulverized and carried to the coal burners in the Boiler (steam generator)
- This steam generated in boiler is fed to turbine assembly which drives the Turbo generator.
- The Turbo generator at its full capacity can deliver 300MW power at 20000 volts.
- This power is stepped up to 400KV in a Transformer and fed to the grid through a network of breakers and buses and power lines.
- Steam entering the condenser is cooled back to water state by circulating cooling water through the condenser.

GHG Inventory Report FY 22-23

- The circulating water in turn is cooled in the cooling tower by evaporative cooling.
- The condensed steam in the condenser pumped back to the boiler by means of boiler feed pump.
- Flue gases from the boiler are cooled in air preheaters and then cleaned by electrostatic precipitators to remove ash.
- The cleaned flue gas is disposed of to atmosphere through the 275-meter height chimney

3. Purpose and objective of the GHG audit report:

The purpose of and objective of this report is to demonstrate continual commitment of GWEL towards sustainable development by reporting its GHG emissions and its directed actions towards reducing the same. This report has been prepared in accordance with the international standards organisation standard ISO 14064-1: 2018. This report will be the most significant to promote transparency on GHG related information & Climate Change initiatives to mitigate the GHG emission levels to the intended users (GWEL, customers and relevant stakeholders) to make reasonable decisions. The information provided in the report by following the requirements outlined in part 9.3.1 and (where applicable) 9.3.2 of the standards.

GHG performance that details in this report will be made available to the intended users through our annual reports, BRSR report, Corporate sustainability reports, investor's information, response to questionnaires and during interactions.

GWEL environment policy demonstrates that, we are committed to protect the environment by effective & responsible consumption, minimization of energy consumption, minimising waste generation, minimising GHG and other emissions & discharges to environment from our activities. To persist the environmental protection, GWEL had taken the strategies to reduce the carbon footprint of the organisation by considering FY2021-22 as a starting year. Reduction activities taken

and documented through internal procedures. The reduction strategies area monitoring and performance reporting on yearly basis.

We have a clearly defined path to reduce emissions in line with the Paris Agreement goals. We have also following TCFD approach to identify our climate related risks and opportunities. We are in the process of setting our emission targets in line with the Science Based Targets approach.

We have taken all reasonable care to ensure that the facts stated as a part of this report are Relevant, complete, consistent, accurate and transparent in all the aspects as on the date of preparation and based on the information and data provided by stakeholders of GWEL.

GWEL reports to the verification body about the facts discovered after the validation/verification on accuracy of GHG emission and removals, during the verification/through this report.

This report covers the GHG emission sources and sinks with in the organisational boundary of GWEL generation site and employee accommodation township for the reporting period FY 23(i.e. from 1st April 2022 to 31st March 2023). GWEL has continuously consolidated its position as a global benchmark for its commitment to transparency and its sustainable and environment friendly growth model. To give continuity to this commitment, we are presenting this GHG inventory report annually. FY 22 is taken as base year reference for future GHG inventories. As we said in the above paragraph, GWEL had taken GHG reduction targets for FY-2030(target year) considering FY22 as base year.

4. GHG Inventory design and development:

Organisation boundary:

Organisation boundary is defined as all the quantified GHG emissions and removals from our Warora power generation site and employee accommodation township.

Chosen Consolidation approach: Operational Control.

Reporting Boundary:

The operational boundaries include the identification of GHG emissions and removals associated with the organisation operations.

- Scope 1: Direct GHG emissions and removals.
- Scope 2: Indirect GHG emissions from imported energy.
- Scope 3: Indirect emissions from transportation.

GHG emissions arising from all activities coming under our operational control for all part of the reporting year. These facilities include:

- Power plant
- Employee accommodation –Township

5. Quantification of GHG emissions and removals:

a) Identified GHG sources and Sinks

1	Scope 1: Direct GHG emissions	Type of GHG
1.1	Direct emissions from stationary combustion source	
1.1.1	Emission Boiler operation(Coal)	CO2, CH4, N2O
1.1.2	Emission from Boiler operation(LDO)	CO2, CH4, N2O
1.1.3	Emission from DG sets & Diesel Engine driven	CO2, CH4, N2O
	Pumps (HSD consumption)	
1.1.4	Emission from Oxy fuel cutting(LPG)	CO2
1.1.5	Emissions from cooking (LPG)	CO2
1.2	Direct emissions from Mobile combustion source	
1.2.1	Emission from vehicles owned & controlled by	CO2, CH4, N2O
	GWEL(HSD)	
1.2.2	Emissions from Dozers, LOCO & other machineries	CO2, CH4, N2O
	for coal & ash handling.(HSD)	
1.2.3	Emission from Motorcycles (Petrol)	CO2, CH4, N2O
1.3	Direct Fugitive Emission	
1.3.1	CO2 Consumption for generator purging	CO2
1.3.2	CO2 Fire Extinguisher used for fire fighting	CO2
1.3.3	SF6 Breaker	SF6
1.3.4	Refrigerant cooling gases (HFCs)	R-22, R-407C, R-
		410A, R134A
1.3.5	Treatment of food waste	CH4
1.3.6	Treatment of waste water	CH4
2	Scope 2: Indirect GHG emission from Imported	Type of GHG
	Energy	

GHG Inventory Report FY 22-23

2.1	Imported Electricity	CO2e
3	Scope 3: Indirect GHG emission from	Type of GHG
	Transportation	
3.1	Emission from upstream transportation	
3.1.1	CO2/ H2 cylinder Transportation	CO2e
3.1.2	Electrical Parts for Transportation (for Maintenance)	CO2e
3.1.3	Chlorine Tonner transportation	CO2e
3.1.4	H2SO4 Transportation	CO2e
3.1.5	HCL Transportation	CO2e
3.1.6	LDO Transportation	CO2e
3.1.7	Coal Transportation – Rail	CO2e
3.1.8	Coal Transportation – Road	CO2e
3.1.8	Coal Transportation- Cargo ship	CO2e
3.2	Emission from downstream transportation	
3.2.1	Ash Transportation- Rail	CO2e
3.2.2	Ash Transportation- Road	CO2e
3.3	Business Travels	
3.3.1	Business Travel – Flight	CO2e
3.3.2	Business Travel – Rail	CO2e
3.3.3	Visitors Transport	CO2e
	Removals (Offsetting)	
1	Direct Removals from Carbon Sequestration	CO2e

b) GHG quantification methodology:

- The ISO 14064-1:2018 and GHG Protocol, CO2 baseline database for Indian power sector user guide -version 18.0 by CEA (Ministry of Power-GOI), provides the methodological framework for calculating the GHG emission. We have adopted these guidelines for quantifying and reporting GHG inventories. GHG is calculated and converted into CO2 equivalent (CO2e) with the help of the specified equivalence emission factors.
- All the calculations of GHG emissions sources are based on emission factor method calculation. All the conversion factors and data used are based on standard accepted protocols [CO2 baseline database for Indian power sector user guide-version 18.0 by CEA (Ministry of Power-GOI), IPCC, GHG Protocol, Emission Factors for Greenhouse Gas Inventories by EPA, etc.
- Methodologies are selected and used in such a way that they reasonably minimise the uncertainty or bias and yield accurate, consistent, and reproducible results, in other words, to ensure consistent results.

GHG Emissions=Activity data(AD) X Emission Factor(EF) X Global Warming potential(GWP)

- Electrical generation equipment is heavily regulated by CEA (Ministry of power, GOI) and is required to report Fuel consumption, Gross calorific value, Heat rate, Auxiliary Power Consumption (APC) on a periodic basis. CO2 emission for coal and other fuel used in stationary combustion is calculated based on fuel, GCV and heat rate data.
- Fugitive emissions from materials and fuels are considered as part of total consumption.

c) Collection of Activity Data:

Activity data is collected consistent with the GHG quantification methodology to quantify the GHG emission and removals. GHG activity data considered for our GHG inventory includes Fuel invoices, ERP logs(SAP), For measuring instruments, calibration is carried out by annual basis.

d) Selection of GHG emission or removal factors:

The selected GHG emission and removal factors are derived from CO2 baseline database for Indian power sector user guide -version 18.0 by CEA (Ministry of Power-GOI), IPCC and DEFRA, India Specific Rail Transport Emission Factors for Passenger Travel and Material Transport, etc. These factors are appropriate and current at the time of quantification and consistent with the intended use of GHG inventory. Through application of documented emission factor and GWPs, GHG emissions from all sources are calculated. If any changes/ upgradations in the sources/ references for the emission factors and GWPs are considered.

g) Calculation of GHG emissions and removals:

GHG emissions and removals are calculated in accordance with the quantification methodology.

h) Baseline year:

GWEL would be considering FY 2021-22 as its base year for GHG accounting and assertion from this year onwards.

i) Greenhouse gas emissions reported:

GWEL Greenhouse Gas inventory includes all the GHG gases relevant to Coal based Power plant and wherever it is possible to estimate them as identified by IPCC. We have been able to ascertain the emission of following gases from our operations:

- Carbon dioxide (CO2)
- Methane (CH4)
- Nitrous oxide (N2O)
- Hydro fluorocarbons (HFCs)
- Sulphur Hexafluoride(SF6)

The total emission expressed in terms to tons of carbon dioxide equivalent (tCO2e).

j) Exclusions:

The Below mentioned are excluded for calculating GHG inventory

• Scope 3: Indirect GHG emissions from Transportation-Visitors' travelling to the site with their own vehicles. This was not done this year as the visits and the usage could not be accurately captured and recorded in our records. This element of GHG Source would be included in the next year report

k) Report Responsibility:

The Cross Function team headed by Shri. Bharat Pinjarkar (Head Operations) is a dedicated team constituted for the compilation of Greenhouse Gas emission data. The CFT collects data, calculates emissions, and is responsible for verifying it externally and reporting it through sustainability reports.

CFT for 2022-23:

GHG Inventory Report FY 22-23

Scope 1 Direct- Emission from Waste treatment									
Emission Source	Gas	GHG gas name	Qty.		CO2 Conversion Factor (Kg/Unit)				
Food Waste - Plant	Gas	CH4	736.19	Kg	8.95	6.5889005			
Food Waste-Township	Gas	CH4	12124	Kg	8.95	108.5098			
Treatment of waste water	Gas	CH4	14013.98	KL	0.272	3.81180256			
Total						118.91			

6.2. Indirect Emissions:

Category 2- Scope 2 Indirect – Purchased electricity(From Grid)								
Emission Source	Amount of	Unit	Emission	Total GHG				
	Electricity Usage		factor	Emission (tCO2e)				
			KgCO2e/K					
			Wh					
Electricity Consumption from Grid	211345	Kwh	0.9	190.21				

6.3. Indirect emissions from upstream transportation:

Category 3 -Scope 3-Indirect Emissions from upstream Transportation							
Emission Source	Qty	Unit	Emission Factor	CO2(Kg)	Total GHG Emission		
			-CO2e		(tCO2e)		
			(Kg/Unit)				
Co2 transportation	640	Km	0.95522	611.3408	0.6113408		
Chlorine Transportation	864	Km	0.95522	825.31008	0.82531008		
H2SO4 Transportation	84600	Km	0.95522	80811.612	80.811612		
HCL Transportation	720	Km	0.95522	687.7584	0.6877584		
LDO Transportation	6720	Km	0.95522	6419.0784	6.4190784		
Electrical parts transportation	1625.2	Km	0.95522	1552.423544	1.552423544		
Coal Transportation - Road	779634	Km	0.95522	744721.9895	744.7219895		
Coal transported through Rly Rake	5640950445	TON-KM	0.00996	56183866.44	56183.86644		
Coal Transportation-By cargo ship	206745000	TON-KM	0.01323	2735236.35	2735.23635		
Total					59754.73		

6.4. Scope 3 –Indirect emissions from Downstream transportation:

GHG Inventory Report FY 22-23

Category 3 -Scope 3-Indirect Emissions from downstream Transportation								
Emission Source Qty Unit Emission Factor CO2(Kg) Total GHG Emiss								
1			-CO2e		(tCO2e)			
			(Kg/Unit)					
Ash transportation through trucks	3305760.9	Km	0.95522	3157728.927				
outside plant premises					3157.728927			
Ash transported through Rly Rake	76906816.8	TON-KM	0.00996	765991.8953	765.9918953			
Total					3923.72			

6.5. Scope 3 -Indirect emissions from Business Travel:

i <u></u>										
Category 3 -Scope 3-Indire										
Emission Source	Total GHG Emission									
			-CO2e		(tCO2e)					
			(Kg/Unit)							
Business Travel - Flight	254822.28	Passenger – KM	0.13003	33134.54107	33.13454107					
Business Travel - Rail	1110	Passenger – KM	0.007837	8.69907	0.00869907					
Visitors Transport- Road	1.4349216									
Total	Total									

6.6. Carbon Offset:

Carbon offset				
			Carbon Sequential Rate	
Nos.of trees planted	Survival Rate	Net avialble	(in kg CO2 per plant-	
As on 31.03.2023	(in %)	trees	year)	Offset tCO2
139050	90	125145	25	3128.63

7. GHG Mitigation and directed activities:

Few Key improvements made on GHG emission reduction during the reporting period are:

- Maximising sourcing of coal from nearest coal mines which has dedicated road constructed by GWEL which reduced Scope 3 emission from upstream transportation.
- Maintaining the Greenbelt with over 1.25lac trees developed over last 10 years of plant operation
- Maximising Transportation of Fly ash through Railway Rakes.
- Various efficiency improvement and Energy conservation projects: The objective of these projects is to reduce Auxiliary power consumption and Heat

rate improvement. These reduction results in an indirect reduction of Greenhouse Gas emissions. The following table contains the details of the energy efficiency projects.

	List of Energy Conservation Projects Imp	lemented in 20)22-23	
SN	Title of Project	Annual	Annual The	ermal
		Electrical	Saving(Fue	e1)
		Saving	Quantity	UOM
		(kWh)		
1	Efficiency Improvement through Unit-2 COH in			MT
	Aug-2022	66,29,040	23,328.00	
	Condenser parting plate leakage arresting.			
	Condenser jet cleaning, hydro test & tube plugging			
	as per requirement.			
	HPH partition plate leakage arresting.			
	Turbine blades sand blasting, flow path correction.			
	CAVT screen installation.			
	Refractory application at boiler first & second pass as per requirement.			
	Reheater spray valve passing issue resolved.			
	Boiler air tightness test and rectification work.			
	APH Overhauling.			
2	Efficiency Improvement through Unit-1 AOH in			MT
	Jul-2022	55,59,840	11,728.80	
	Condenser jet cleaning, hydro test & tube plugging			
	as per requirement			
	HPH partition plate leakage arresting			
	GV inspection & rectification			
	IDF anti erosion coating			
	Coal Pipe Orifice rectification			
	Flue gas & air duct inspection, rectification &			
	Ceramic lining done.			
3	ESP GD screen replacement. AI & ML based Predictive Analytics for Plant			
3	Performance & Reliability Improvement	12,60,000.00		
	renormance & Renability improvement	12,00,000.00		
4	Cooling Tower Performance Improvement			MT
	Programme (Existing Cooling Tower Drift		35,832.39	1111
	Eliminator, Nozzle & Fill Replacement, CW line)	
	modification etc.)			
5	Utilisation of fluidized air for hopper instead of			
	hopper heater in ESP	2,95,680.00		
6	Installation of Vibro Feeder in Second Stream			L
	Conveyor-BCN-2A	14,490.60	16,961.54	
7	Unit 2 HP Heater-6,7 & 8 partition plates		0.5.5.5.	MT
	replacement		988.63	

GHG Inventory Report FY 22-23

8	Optimal Operation of LED along with conversion of Conventional Lights with LED along with reduction in LED wattage.	24,01,800.00		
9	Reduction in Start-up Oil consumption by 10% by adopting various operational strategies using six sigma methodology.	58.87		KL
10	Implementation of CFD & CAVT Test recommendation at flue gas duct in boiler second pass	5,96,000.00		
11	Application of Anti-erosion Coating in ID fan-1A and 1B Impeller	5,59,671.55		
12	Optimization of CW/ACW Pump & CT Fan running hours	3,91,564.32		
13	Intelligent flow controller (IFC) installation in Compressed Air System.	2,32,505.00		
14	Water Treatment Plant Power Consumption Optimization by using the CW return line water instead of Effluent Recirculation feed pump.	30,800.00		
15	MRHS System Power saver mode logic modification for energy conservation.	23,760.00		
16	Optimization of Economiser and ESP deashing period by reducing the number of operation cycles.	24,000.00		
17	CCCW Pump-2A & 2B Overhauling & PHE Jet cleaning	1,56,625.73		

8. GHG Inventory Quality Management

Complying with ISO14064-1:2018, System is in place to assess our GHG emissions and all the GHG sources are consistently monitored to ascertain consistency in GHG inventory.

Activity data is collected consistent with the GHG quantification methodology to quantify the GHG emission and removals.

GHG activity data considered for our GHG inventory includes Fuel invoices, ERP logs (SAP), For measuring instruments, calibration is carried out by annual basis. Concerned employees are provided with required training.

References/ Standards/ Protocols followed.

- ISO 14064-1:2018
- CEA (Ministry of Power-GOI)
- IPCC
- GHG Protocol

- EPA
- DEFRA

9. Results

GWEL's GHG emission is **39,22,342.07** tonnes of CO2e. This represents direct emissions from fuel combustion and energy generation (Scope 1), Indirect emissions from purchased electricity (Scope 2), and indirect emissions from upstream and downstream transportation (Scope 3).

This GHG inventory assertion GWEL for the reporting year is done using the ISO 14064-1:2018 standard; i.e. - specification with guidance at the organization level for quantification and reporting of greenhouse gas emissions and removals.

SN	GHG Emission		FY 23
1	Total Scope 1 Direct Emissions tCO2e		38,61,567.45
2	Total Scope 2 Indirect Emissions tCO2e		190.21
3	Total Scope 3 Indirect Emissions from Transportation		63,713.03
	tCO2e		
4	Total mission(Direct & Indirect) tCO2e		39,25,470.70
5	Offset tCO2 through Plantation		3,128.63
6	Total Emission(Direct & Indirect) after offsetting		39,22,342.07
7	Net Station Generation (Mwh)		43,18,716.00
8	Sp.GHG Emission		0.8941
	(Direct)		
9	Sp.GHG Emission		0.9089
	(Direct & Indirect)		
10	Sp.GHG Emission after carbon offset		
		0.9082	
11	Sp.GHG Emission (Scope 3)	0.0148	

GHG Emission	FY 23	FY 22	Change
Specific GHG Emission tCo2/Mwh (Direct)	0.8941	0.8947	-0.1%
Specific GHG Emission tCO2/Mwh (Direct & Indirect)	0.9089	0.9137	-0.5%
